

## AWS Exam - feb 2025, John Bryce

### Section 1: Multiple Choice Questions (MCQs)

1. C
2. A
3. C
  
4. A
5. B
  
6. B
7. A
  
8. B
9. C
  
10. C
11. A

12. AWS Landing Zones are essentially blueprints for setting up a secure, multi-account AWS environment that adheres to best practices right from the start. They help organizations quickly establish a standardized architecture by automating the provisioning of accounts, networks, and security baselines. Here's how they contribute to multi-account governance such as Standardized Account Structure, Centralized Governance, security and Compliance Automation Scalability and Flexibility.

13. AWS WAF (Web Application Firewall) is designed to protect web applications by monitoring, filtering, and blocking malicious HTTP and HTTPS traffic before it reaches your backend servers. Here one of many ways to protect your traffic in aws like Real-Time Monitoring and Logging:  
AWS WAF integrates with Amazon CloudWatch, providing real-time metrics and logs that help you analyze traffic patterns and quickly identify potential security issues.

14. AWS Snowball is a secure, physical data transfer device designed to move large amounts of data into or out of the AWS Cloud. Here's what makes it valuable and when you should use it,

#### High-Volume Data Transfer:

Snowball is ideal for transferring terabytes to petabytes of data when network bandwidth is limited, unreliable, or too costly for a timely online transfer.

#### Physical Data Transport:

Instead of sending data over the internet, you load your data onto the Snowball device, which is then physically shipped back to AWS. This method can significantly reduce transfer times for large datasets.

**15. AWS Backup and manual snapshot backups both serve the purpose of data protection, but they differ significantly in functionality, management, and automation. Here are the key differences:**

**Policy Enforcement & Compliance:**

- **AWS Backup:** Enables you to enforce backup policies organization-wide, ensuring compliance with governance and regulatory standards.
- **Manual Snapshots:** Lack centralized policy control, making it challenging to ensure uniform compliance.

**Integration with Other AWS Services:**

- **AWS Backup:** Seamlessly integrates with services like AWS Organizations, allowing centralized backup management across your entire AWS estate.
- **Manual Snapshots:** Limited to the native backup capabilities of each individual service.

**16. AWS Shield is a managed Distributed Denial of Service (DDoS) protection service that helps safeguard your AWS applications by detecting and mitigating DDoS attacks in real time. Here is one example:**

**Automated Detection & Mitigation:**

- **AWS Shield Standard:** Automatically protects your applications against common network and transport layer DDoS attacks (like SYN/UDP floods or reflection attacks) without any additional configuration. It leverages AWS's global infrastructure to detect abnormal traffic patterns and immediately starts mitigating the attack.
- **AWS Shield Advanced:** Offers enhanced detection capabilities with deeper visibility into sophisticated attacks. It provides additional mitigation strategies, which can be tailored to your application's specific needs.

**17. AWS Transit Gateway and VPC Peering both enable communication between VPCs, but they differ significantly in architecture, scalability, routing, and management. Here's a breakdown of the key differences:**

### Connectivity Model

- **AWS Transit Gateway:**
  - **Hub-and-Spoke Architecture:** Acts as a central hub where multiple VPCs, on-premises networks, and even remote offices connect.
  - **Transitive Routing:** Allows any connected network to communicate with any other through the central gateway.
- **VPC Peering:**
  - **Direct Connection:** Establishes a one-to-one relationship between two VPCs.
  - **No Transitive Routing:** If VPC A is peered with VPC B and VPC B is peered with VPC C, A cannot communicate with C through B.

### Routing and Performance

- **AWS Transit Gateway:**
  - **Centralized Routing Tables:** Offers centralized control over routing, making it easier to manage network paths and security boundaries across multiple connections.
  - **Efficient Data Flow:** Designed to handle high throughput and optimized for scenarios with multiple interconnections.
- **VPC Peering:**
  - **Distributed Routing:** Each VPC maintains its own routing tables, and routing is only configured for the directly connected peers.
  - **Low Latency:** Provides direct paths between two VPCs, which may result in lower latency in simple, pairwise scenarios.

**18. AWS Step Functions is a fully managed service that simplifies the orchestration of complex workflows by allowing you to coordinate multiple AWS services into serverless workflows like:**

#### Orchestration of AWS Services:

It seamlessly integrates with services like AWS Lambda, ECS, Batch, and more. This allows you to break down complex processes into smaller, independent tasks that are executed in a specific order, reducing the need to write custom orchestration code.

**19. AWS Control Tower simplifies and automates the process of managing multiple AWS accounts by providing a centralized, secure, and compliant multi-account environment. You can do is with Automated Landing Zone Setup:** AWS Control Tower sets up a standardized, multi-account environment (called a landing zone) following AWS best practices. This includes configuring foundational services like identity management, logging, and security controls from the start. And with Pre-Configured Guardrails: It implements preventive and detective guardrails—predefined policies that enforce compliance, security, and operational best practices across all accounts.

**20. AWS Outposts plays a pivotal role in hybrid cloud solutions by seamlessly extending AWS infrastructure, services, and tools to on-premises environments. This integration brings several key benefits:**

**Consistent Cloud Experience On-Premises:**

Outposts provides the same hardware, APIs, and management tools as in AWS regions, ensuring that developers and operations teams can build and manage applications uniformly across both environments.

**Low Latency and Local Data Processing:**

For applications requiring real-time processing or minimal latency, keeping compute and storage resources on-premises with Outposts ensures data is processed locally while still leveraging AWS services.

**Data Residency and Compliance:**

Organizations with strict regulatory or data residency requirements can store and process sensitive data on-site, while still benefiting from AWS's robust cloud capabilities.

And more.

**21. AWS Elastic File System (EFS), Amazon S3, and Amazon EBS** each provide storage solutions with distinct characteristics tailored to different use cases. Here's how EFS compares to S3 and EBS:

### AWS Elastic File System (EFS)

- **Type:** Fully managed, scalable network file system.
- **Access:** Provides a standard file system interface (NFS), enabling multiple EC2 instances or containers to share files concurrently.
- **Scalability:** Automatically scales as you add or remove files.
- **Use Cases:**
  - **Shared File Storage:** Ideal for applications where multiple instances need simultaneous access to the same files (e.g., content management systems, web serving, and collaborative tools).
  - **Lift-and-Shift Applications:** Good for legacy applications that expect a POSIX-compliant file system.
  - **Big Data & Analytics:** Can be used as a repository for data that is concurrently processed by multiple instances.
  - **Container Storage:** Supports containerized applications requiring persistent, shared storage.

### Amazon S3

- **Type:** Object storage service.
- **Access:** Uses RESTful APIs; doesn't offer POSIX file system semantics.
- **Scalability:** Highly scalable and designed for storing vast amounts of unstructured data.
- **Use Cases:**
  - **Data Lakes & Big Data Analytics:** Stores and organizes large datasets for analytics and machine learning.
  - **Backup & Archiving:** Durable storage for backups, archives, and disaster recovery.
  - **Static Content Hosting:** Ideal for hosting static websites, images, videos, and other unstructured content.
  - **Application Data Storage:** Serves as a backend for applications that can work with objects rather than files.

### Amazon EBS

- **Type:** Block storage.
- **Access:** Provides low-level storage volumes that attach directly to EC2 instances (typically one instance at a time, with some exceptions).
- **Performance:** Offers high-performance, low-latency storage suitable for transactional workloads.
- **Use Cases:**
  - **Databases & Transactional Applications:** Perfect for applications requiring consistent low-latency block storage (e.g., relational databases, NoSQL databases).

- **Boot Volumes & Persistent Storage:** Used as the primary storage for operating systems and application data on EC2 instances.
- **High-Performance Workloads:** Provides configurable IOPS for performance-intensive applications.

## Summary

- **EFS** is best when you need a scalable, shared file system with standard file system semantics accessible by multiple instances concurrently.
- **S3** is ideal for storing and retrieving massive amounts of unstructured data, serving as a data lake, backup solution, or content repository.
- **EBS** is tailored for high-performance, single-instance block storage, suitable for databases, boot volumes, and applications requiring low-latency access.

By understanding these differences, you can choose the right storage solution based on your application's access patterns, performance needs, and scalability requirements.

## Section 2: Hands-on UI-Based Questions

### 1. S3 Bucket Configuration

The screenshot shows the AWS S3 Bucket Properties page for the bucket 'benny-aws-exam'. The left sidebar includes links for General purpose buckets, Storage Lens, and AWS Marketplace for S3. The main content area has tabs for Objects, Metadata, Properties (selected), Permissions, Metrics, Management, and Access Points. Under Properties, there are sections for Bucket overview, Bucket Versioning, Tags, and Default encryption. Bucket Versioning is enabled. A note about Multi-factor authentication (MFA) delete is present. The Tags section contains one tag: 'exam' with value '1. S3 Bucket Configuration'. The Default encryption section notes server-side encryption with Amazon S3 managed keys (AES-256).

The screenshot shows the AWS S3 Bucket Block Public Access settings page for the bucket 'benny-aws-exam'. The left sidebar includes links for General purpose buckets, Storage Lens, and AWS Marketplace for S3. The main content area shows 'Block all public access' is turned 'On'. It also lists 'Individual Block Public Access settings for this bucket'. Below this is a 'Bucket policy' section with a note that public access is blocked because Block Public Access settings are turned on. A JSON code editor displays a policy document allowing 'terraform' to upload objects to the bucket.

IAM Policy to prevent other users to upload

## 2. Launch an EC2 Instance

The screenshot shows the AWS Management Console with the EC2 Instances page open. A single EC2 instance named "benny-aws-exam" is listed as "Running". The instance type is t2.micro. The status check shows "Initializing". The sidebar on the left includes links for Dashboard, EC2 Global View, Events, Instances (selected), Instance Types, Launch Templates, Spot Requests, Savings Plans, Reserved Instances, Dedicated Hosts, Capacity Reservations, Images (AMIs, AMI Catalog), Elastic Block Store (Volumes, Snapshots, Lifecycle Manager), Network & Security (Security Groups, Elastic IPs, Placement Groups, Key Pairs, Network Interfaces), and Load Balancing (Load Balancers). The bottom of the screen displays the AWS footer with links for CloudShell, Feedback, Privacy, Terms, and Cookie preferences.

EC2 t2.micro

The screenshot shows the AWS Management Console with the Security Groups page open for a specific security group. The security group ID is sg-0204ab31f47251aa1 and it is associated with the instance "benny-aws-exam". The page displays details such as the security group name, owner, and VPC ID. Under the "Inbound rules" tab, there are two entries:

Name	Security group rule ID	IP version	Type	Protocol	Port range	Source
-	sgr-08a8b0fcaa502275a	IPv4	HTTP	TCP	80	0.0.0.0/0
-	sgr-00b6815158a410e1f	IPv4	SSH	TCP	22	0.0.0.0/0

SSH and HTTP port

### 3. Configure an IAM User with S3 Access

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3>ListBucket"
      ],
      "Resource": "arn:aws:s3:::benny-aws-exam"
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject",
        "s3:PutObject",
        "s3>DeleteObject"
      ],
      "Resource": "arn:aws:s3:::benny-aws-exam/*"
    }
  ]
}
```

The screenshot shows the AWS IAM Policies page for the 'benny-aws-exam' user. The policy document is as follows:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3>ListBucket"
      ],
      "Resource": "arn:aws:s3:::benny-aws-exam"
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject",
        "s3:PutObject",
        "s3>DeleteObject"
      ],
      "Resource": "arn:aws:s3:::benny-aws-exam/*"
    }
  ]
}
```

The 'Permissions' tab is selected, showing the following permissions defined in the policy:

- Actions:** Actions in S3 (4 of 163)
  - Read (1 of 63):** Action: GetObject, Resource: BucketName| string like |benny-aws-exam, ObjectPath| string like |All, Request condition: None
- Write (2 of 65):** Action: DeleteObject, Resource: BucketName| string like |benny-aws-exam, ObjectPath| string like |All, Request condition: None; Action: PutObject, Resource: BucketName| string like |benny-aws-exam, ObjectPath| string like |All, Request condition: None
- List (1 of 13):** Action: ListBucket, Resource: BucketName| string like |benny-aws-exam, Request condition: None

Policy that give access to specific s3 bucket access

## Set Up a CloudWatch Alarm

The screenshot shows the AWS CloudWatch Alarms interface. On the left, a sidebar lists various monitoring categories like AI Operations, Metrics, and Events. The 'Metrics' section is expanded, showing several alarms, with one named 'Dan-70-alarm' highlighted. The main panel displays a timeline from 15:30 to 18:15, showing the state of the alarm. Below the timeline, the 'Details' tab is selected, providing a detailed view of the alarm configuration.

Setting	Value
Name	CloudWatch Alarm
Type	Metric alarm
Description	your cpu is reached to 70% please take action
Threshold	CPUUtilization >= 70 for 1 datapoints within 5 minutes
Last state update	2025-02-17 18:29:57 (UTC)
Actions	Actions enabled
Namespace	AWS/EC2
Metric name	CPUUtilization
InstanceId	i-084cad85b72e19fe2
Instance name	benny-aws-exam
Statistic	Average
Period	5 minutes
Datapoints to alarm	1 out of 1
Missing data treatment	Treat missing data as missing
Percentiles with low samples	evaluate
ARN	arn:aws:cloudwatch:us-east-1:504949722475:alarm:CloudWatch Alarm

Alarm on EC2 that trigger wen cpu is loaded over 70%

## Section 3: Hands-on advanced

### 1. Deploy an Auto Scaling Group with a Single EC2 Instance

The screenshot shows the AWS EC2 Instances page. On the left, a sidebar navigation includes: Dashboard, EC2 Global View, Events, Instances (selected), Instance Types, Launch Templates, Spot Requests, Savings Plans, Reserved Instances, Dedicated Hosts, Capacity Reservations, Images (AMIs, AMI Catalog), Elastic Block Store (Volumes, Snapshots, Lifecycle Manager), Network & Security (Security Groups, Elastic IPs, Placement Groups, Key Pairs, Network Interfaces), Load Balancing (Load Balancers), CloudShell, and Feedback. The main content area displays the 'Instances (1) Info' section with a table showing one instance: Name (benny-aws-exam), Instance ID (i-0ef99d92855ac21e), Instance state (Running), Instance type (t2.micro), Status check (Initializing). A 'Select an instance' dropdown is open below the table. The top navigation bar shows tabs like Instances | EC2 | us-east-1, vpcs | VPC Console, and VPC | us-east-1.

The screenshot shows the AWS Security Groups page. The sidebar navigation is identical to the previous screenshot. The main content area shows the details for a security group named 'sg-0204ab31f47251aa1 - benny-aws-exam'. It lists the security group name (benny-aws-exam), security group ID (sg-0204ab31f47251aa1), owner (504949722475), and VPC ID (vpc-0b1f251cfb67cd0b6). Below this, the 'Inbound rules' tab is selected, showing two entries: one for port 80 (HTTP) and another for port 22 (SSH). The top navigation bar shows tabs like SecurityGroup | EC2 | us-east-1, vpcs | VPC Console, and VPC | us-east-1.

Type of ec2 and open ports

## 2. Connect to the EC2 Instance and Install Nginx

```
ip-10-0-0-89:~ + Share Q A B
sudo systemctl start nginx
21:35 ubuntu@ip-10-0-0-89 ~ (0.986s)
sudo systemctl enable nginx
Synchronizing state of nginx.service with SysV service script with /usr/lib/systemd/systemd-sysv-install.
Executing: /usr/lib/systemd/systemd-sysv-install enable nginx

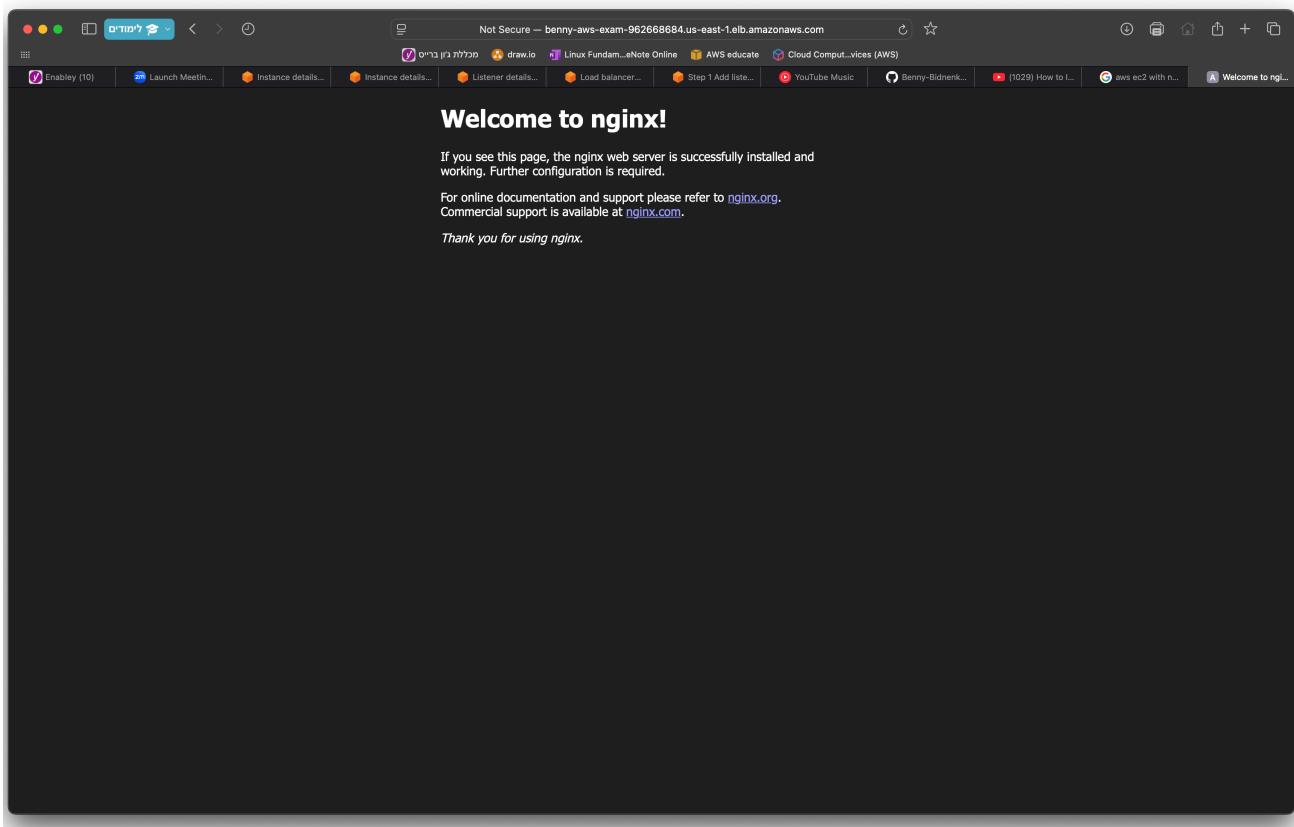

21:35 ubuntu@ip-10-0-0-89 ~ (0.18s)
curl http://localhost:80
<!DOCTYPE html>
<html>
<head>
<title>Welcome to nginx!</title>
<style>
html { color-scheme: light dark; }
body { width: 35em; margin: 0 auto;
font-family: Tahoma, Verdana, Arial, sans-serif; }
</style>
</head>
<body>
<h1>Welcome to nginx!</h1>
<p>If you see this page, the nginx web server is successfully installed and
working. Further configuration is required.</p>

<p>For online documentation and support please refer to
<a href="http://nginx.org/">nginx.org</a>.<br/>
Commercial support is available at
<a href="http://nginx.com/">nginx.com</a>.</p>

<p><em>Thank you for using nginx.</em></p>
</body>
</html>

21:35 ubuntu@ip-10-0-0-89 ~ 36 Agent Mode
curl http://localhost:80/index.html [→]
```

Connected to ec2 and nginx installed

Access the Web Page via the Load Balancer

## 4. IAM User Setup for S3 Access

The screenshot shows the AWS IAM Policy details page for a user named 'benny-exam-s3-user'. The policy is titled 'Policy benny-exam-s3-user created.' and is a customer-managed policy. It was created on February 17, 2025, at 22:22 UTC+02:00. The ARN is arn:aws:iam::504949722475:policy/benny-exam-s3-user. The 'Permissions' tab is selected, showing the following JSON code:

```
1 [ { 2   "Version": "2012-10-17", 3     "Statement": [ 4       { 5         "Effect": "Allow", 6         "Action": [ 7           "s3:listBucket" 8         ], 9         "Resource": "arn:aws:s3:::benny-aws-exam" 10      }, 11      { 12        "Effect": "Allow", 13        "Action": [ 14          "s3:GetObject", 15          "s3:PutObject", 16          "s3:DeleteObject" 17        ], 18        "Resource": "arn:aws:s3:::benny-aws-exam/*" 19      } 20    ] 21  } ]
```

User S3 can Access to S3 bucket only
